

Pink Salt Business Unit

Working Blueprint

Blue Ocean Market Management OS

South Korea operations • Base currency: KRW • Import, repacking, inventory and sales

STATUS	BUSINESS MODEL	DOCUMENT DATE
Planning / Design Phase	Import + Repack + Sell	28 August 2026

1. Business Model Overview

Pink Salt is operated in South Korea, therefore KRW is the base and accounting currency. The business purchases pink salt from Pakistani suppliers, imports it into Korea, stores it as raw material, repacks it into smaller retail or wholesale products, stores the finished goods, and sells through ecommerce platforms, local stores, wholesale customers, gift orders and other channels.

**Pakistan Supplier → Purchase / Import → Container / Shipment → Raw Salt Stock
→ Repacking / Processing → Finished Product Stock → Sales / Orders → Finance**

2. Purchase & Import Management

- **One import/purchase** may contain multiple salt categories in the same supplier invoice, shipment and container.
- Use one Import / Shipment header with multiple salt-item lines rather than creating separate imports for each salt grade.
- Typical grades include Mesh, 2-3 mm and 3-5 mm, but categories must be flexible so users can add new grades/specifications later.
- Imported bag sizes are commonly 20 kg or 25 kg, but custom bag sizes must also be supported.
- Each salt line should store: category/grade, bag size, number of bags, total weight, purchase rate/amount if applicable, and notes/specification.

Example: one mixed-category container

Salt Category	Bags	Bag Size	Total Weight	Import Link
Mesh	50	25 kg	1,250 kg	PS-IMP-2026-001
2-3 mm	30	25 kg	750 kg	PS-IMP-2026-001
3-5 mm	20	25 kg	500 kg	PS-IMP-2026-001
TOTAL	100		2,500 kg	Same container

3. Currency & Import Payments

- KRW remains the base/accounting currency for Finance, stock valuation, landed cost and profit reporting.
- Import invoices and payments may be entered in KRW, USD or PKR.
- For each payment, store the original currency, original amount, exchange rate used, converted KRW amount, payment date, method, reference and evidence.
- One import may have multiple payments, and different payments may use different currencies if required.
- The original foreign-currency information and exchange rate must always be preserved for audit and reference.

Invoice Currency	Original Amount	Exchange Rate	KRW Equivalent
USD	\$12,000	1 USD = ₩1,380	₩16,560,000
PKR	PKR 3,500,000	1 PKR = ₩4.95	₩17,325,000

4. Import / Landed Cost

Besides the Pakistani supplier price, the import record should support all costs required to bring the salt into usable Korean stock.

- International freight
- Customs / duties
- Port and clearance charges
- Korean inland transport
- Inspection / handling
- Other import-related expenses

Recommended allocation rule: shared container-level expenses should default to weight-based allocation across salt categories, while allowing authorized manual adjustment when needed.

5. Raw Salt Stock / Yard Inventory

- Each import should create an Import Batch / Lot reference.
- Different salt grades from the same container maintain separate stock balances but remain linked to the same supplier, invoice, shipment and container.
- Raw stock should primarily be controlled in kilograms while preserving bag count and bag size.
- Track received quantity, available kg, reserved kg, quantity consumed in repacking, waste/damage and yard/storage location.
- Users should always be able to see the exact available quantity of every salt grade and the import batch it came from.

6. Repacking / Production

- Create a Repacking / Production Batch when raw salt is converted into saleable packs.
- User selects the raw import batch, salt category/grade and quantity in kilograms to consume.
- The production batch specifies the finished products to be produced and their package sizes.
- Common retail/finished sizes include 250g, 400g, 500g, 1kg, 2kg, 3kg and 5kg, plus gift-box configurations.
- Pack sizes and product types must remain flexible for future additions.
- System should calculate expected output and compare it with actual finished output.

Production yield example

Raw Input	100 kg of 2-3 mm Pink Salt
Target Product	500g retail packs
Expected Output	200 packs
Actual Output	196 packs = 98 kg
Recorded Waste	2 kg

7. Waste Management

Waste must be recorded as a proper inventory movement rather than disappearing from stock.

- Repacking loss
- Spillage
- Moisture / quality issue
- Damaged salt
- Sample / testing use
- Damaged finished product
- Packaging damage

Management reporting should show waste quantity, waste %, reason, production batch and estimated cost impact.

8. Packaging Materials Inventory

- Packaging materials should be managed as inventory, not only as expenses, because production depends on their availability.

- Possible materials include pouches/bags, jars or bottles if used, labels, stickers, gift boxes, cartons, tape, inserts and other consumables.
- Track supplier, unit, purchase price, stock received, stock consumed, damaged/wasted quantity, available balance and low-stock threshold.

9. Packing Recipe / BOM

Each finished SKU should have a small packing recipe (Bill of Materials) so repacking automatically consumes both salt and packaging.

Finished SKU	Required Raw Salt	Packaging Consumption
PS-MESH-500G	0.500 kg Mesh Pink Salt	1 x 500g pouch + 1 label + carton allocation

10. Finished Goods / SKU Inventory

- Finished goods should use unique SKU/product codes based on salt grade, package size and packaging style.

Example SKUs: PS-MESH-250G, PS-MESH-500G, PS-23MM-1KG, PS-35MM-5KG, PS-MESH-400G-GIFT.

- Each SKU should track Available, Reserved, Sold, Returned and Damaged quantities.
- Finished batches must retain traceability back to the source raw-salt import batch.

11. Batch Traceability

Traceability should work in both directions.

Finished Product → Repacking Batch → Raw Salt Batch → Container → Pakistani Supplier → Purchase / Import Documents

Import Batch → Repacking Batches → Finished SKUs → Orders / Customers / Sales Channels

12. Sales & Orders

- Use one centralized Sales / Orders module with a Sales Channel field instead of completely separate inventory systems for each platform.
- Channels may include Korean ecommerce marketplaces, direct online sales, local stores, wholesale/bulk customers, corporate/gift orders and manual orders.
- Orders should be able to reserve finished stock; stock is deducted when dispatched/completed according to the operational workflow.
- The same system should support individual ecommerce packs as well as carton/bulk/local-store orders.
- Later, ecommerce integrations can be added where technically and commercially useful.

13. Finance Integration & Product Costing

- Purchases, import expenses, packaging purchases, production/repacking costs and sales should connect to Finance.
- Financial reporting remains KRW-based while preserving original foreign-currency transaction details.
- True finished-product cost should include the appropriate share of raw salt purchase cost, freight, customs/clearance, Korean inland transport, packaging material, processing/repacking costs and production waste.
- This enables reliable gross profit by SKU, package size, customer/order and sales channel.

14. Proposed Pink Salt Navigation

Dashboard	Imports / Purchases	Raw Salt Stock	Repacking / Production
Finished Goods	Packaging Materials	Sales / Orders	Customers / Stores
Finance	Documents	Notifications	Global / Common Modules

15. Dashboard - Suggested KPIs

- Raw salt available by category (kg)
- Finished goods quantity and stock value
- Packaging material low-stock alerts
- Current repacking / production batches
- Waste quantity and waste %
- Pending imports and arrivals
- Pending customer orders
- Sales today / this month

- Sales by channel
- Best-selling SKUs
- Gross profit / margin indicators

16. Current Design Principle

The Pink Salt unit should be built around batch-based inventory and light production/repacking, not simple purchase-and-sale stock. The design must keep imported raw stock, repacking activity, packaging-material consumption, finished goods, sales and Finance separate enough for control, but fully linked for traceability and costing.

Current status: Working blueprint only. The Pink Salt workflow is still being refined; implementation should begin only after the final business workflow and screen/form design are approved.
